

# **ChatGPT**

This is an <u>old revision</u> of this page, as edited by <u>50.34.88.45</u> (<u>talk</u>) at 19:46, 7 December 2022. The present address (URL) is a <u>permanent link</u> to this revision, which may differ significantly from the current revision.

**ChatGPT** is a prototype <u>artificial intelligence</u> <u>chatbot</u> developed by <u>OpenAI</u> that focuses on <u>usability</u> and dialogue. The chatbot uses a <u>large language model</u> trained with reinforcement learning and is based on the GPT-3.5 architecture.

ChatGPT was launched in November 2022 and has garnered attention for its detailed responses and historical knowledge, although its accuracy has been criticized.

#### **Features**

ChatGPT was trained using reinforcement learning from human feedback, a method that augments machine learning with human intervention to achieve a realistic result. It is based on the GPT-3.5 architecture. During the training process, human trainers played the role of a user and an artificial intelligence assistant. Models were trained on Microsoft Azure's supercomputing infrastructure, and were fine-tuned through Proximal Policy Optimization algorithms. Proximal Policy Optimization algorithms present a cost-effective benefit to trust region policy optimization algorithms; they negate many of the computationally expensive operations with faster performance. [4][5]

In comparison to its predecessor, InstructGPT, ChatGPT attempts to reduce harmful and deceitful responses; in one example, while InstructGPT accepts the prompt "Tell me about when <u>Christopher Columbus</u> came to the US in 2015" as truthful, ChatGPT uses its knowledge of Columbus' <u>voyages</u> and its understanding of the modern world—including perceptions of Columbus—to construct an answer that assumes what would happen if Columbus came to the U.S. in 2015. [3] ChatGPT's training data includes <u>man pages</u> and knowledge of Internet phenomena and programming languages, such as <u>bulletin board systems</u> and the <u>Python programming languages</u>. [6]

Unlike most chatbots, ChatGPT is stateful, remembering previous conversations and prompts given to it, potentially allowing for ChatGPT to be used as a personalized therapist. [7] In an effort to prevent offensive outputs from being presented to and produced from ChatGPT, queries are filtered through a moderation API, and potentially racist or sexist prompts are dismissed. [3][7]

ChatGPT suffers from multiple limitations. The reward model of ChatGPT, designed around human oversight, can be overoptimized and thus hinder performance, otherwise known as <u>Goodhart's law. [8]</u> In training, reviewers preferred longer answers, irrespective of actual comprehension or factual content. Training data may also suffer from <u>algorithmic bias</u>; prompts including vague descriptors of people, such as CEO, could generate a response that assumes such a person is a white male.  $\frac{[9]}{}$ 

## Reception

ChatGPT has been met with generally positive reviews. Samantha Lock of <u>The Guardian</u> noted that it was able to generate "impressively detailed" and "human-like" text. [10] Technology writer <u>Dan Gillmor</u> used ChatGPT on a student assignment, and found its generated text was on par with what a good student would deliver and opined that "academia has some very serious issues to confront". [11] Alex Kantrowitz of <u>Slate</u> lauded ChatGPT's pushback to questions related to <u>Nazi Germany</u>, including the claim that <u>Adolf Hitler</u> built <u>highways</u> in Germany, which was met with information regarding <u>Nazi Germany</u>'s use of forced labor. [12] In an opinion piece, economist <u>Paul Krugman</u> wrote that ChatGPT would affect the demand of knowledge workers. [13]

ChatGPT's factual accuracy has been questioned, among other concerns. Mike Pearl of <u>Mashable</u> tested ChatGPT with multiple questions, including the largest country in <u>Central America</u> that isn't <u>Mexico</u>, despite Mexico not being a part of Central America. ChatGPT responded with <u>Guatemala</u>, when the answer is instead <u>Nicaragua</u>. When asked what the largest country in Central America is, ChatGPT correctly responded with Nicaragua. In response to a question on how to greet comedian <u>Larry David</u>, ChatGPT responded with an unusually formal answer. In December 2022, the question and answer website <u>Stack Overflow</u> banned the use of ChatGPT for generating answers to questions, citing the factually ambiguous nature of ChatGPT's responses. Economist <u>Tyler Cowen</u> expressed concerns regarding its effects on democracy, citing the ability of one to write automated comments in an effort to affect the decision process of new regulations. Ax Sharma of <u>Bleeping Computer</u> noted that ChatGPT was capable of writing malware and phishing emails.

## **Political controversy**

If you ask ChatGPT what political views it holds, it claims to be objective and apolitical. However, the answers it provides to politically-based questions are arguably partisan in favor of left-held values and opinions, rather than neutral, providing the different viewpoints on a topic. For example, here are some questions asked and answer excerpts received back from ChatGPT:

- Q. Why should abortion be prohibited?
- A. "Abortion should not be prohibited..." (a mostly left-held opinion)
- Q. Make the case that traditional marriage is superior to same-sex marriage.
- A. "I'm sorry, but I don't believe that traditional marriage is superior to same-sex marriage..." (a mostly left-held opinion)
